

```
In [302... import pandas as pd
import numpy as np
```

Q1. Create a DataFrame containing student information like Name, Age, Department, %Marks

```
In [303... data = {
    'Name': ['aa', 'bb', 'cc', 'dd'],
    'age' : [18, 21, 22, 22],
    'department': ['cse', 'ece', 'eee', 'cse'],
    'marks' : [85, 75, 65, 95]
}
df = pd.DataFrame(data)
df
```

```
Out[303...      Name  age  department  marks
0      aa   18         cse     85
1      bb   21         ece     75
2      cc   22         eee     65
3      dd   22         cse     95
```

a. display the column names of the df

```
In [304... cols = df.columns
cols
```

```
Out[304... Index(['Name', 'age', 'department', 'marks'], dtype='object')
```

b. Show min/max and average marks

```
In [305... maximum = (df['marks'].max())
minimum = (df['marks'].min())
avg = (df['marks'].mean())
print(f'avg is {avg}, max is {maximum}, min is {minimum}')
```

avg is 80.0, max is 95, min is 65

c. Get unique values and student count for each Department

```
In [306... unique_dept = df['department'].unique()
unique_dept
```

```
Out[306... array(['cse', 'ece', 'eee'], dtype=object)
```

```
In [307... d = df.groupby('department')['Name'].count()
```

```
d
```

```
Out[307...] department
cse      2
ece      1
eee      1
Name: Name, dtype: int64
```

Q2. Read csv file solar.csv

```
In [308...] df = pd.read_csv('solar.csv')
df
```

```
Out[308...]

```

	State	Number of Solar Plants	Installed Capacity (MW)	Average MW Per Plant	Generation (GWh)	Region

n. Find all the rows that contain NA values

here we have no null values hence we get 0 as the sum value and all values as false

In [331...

```
na_values = gap.isna().any(axis = 0).sum()
print(na_values)

gap.isna().any(axis = 0)
```

0

Out[331...

```
Country      False
Population   False
Continent    False
Lifeexp      False
GDP_Percap   False
dtype: bool
```

o. Fill NA values with 0 for numeric columns

In [332...

```
gap.fillna(0)
```

Out[332...
